PRATEEK GUPTA

Associate DevOps Engineer | Azure | Terraform | DevSecOps

sre.prateek@gmail.com | +91-9580991574 | Greater Noida, India

Portfolio | **LinkedIn** | **GitHub**

PROFESSIONAL SUMMARY

Associate DevOps Engineer with hands-on Azure experience, specializing in Infrastructure as Code (Terraform), Azure Landing Zone design, and DevSecOps-driven CI/CD pipelines using Azure DevOps, Azure Pipelines, Git and GitHub. Skilled at translating business requirements into HLD/LLD for secure, scalable, cost-efficient network and cloud architectures. Proficient in Azure core networking (VNet peering, Hub-Spoke topology, ExpressRoute, VPN Gateway, Private Endpoints, Azure Firewall, Application Gateway, Load Balancer), infrastructure security scanning (tfsec, tflint, Checkov), and cost governance (Infracost, Azure Cost Management).

TECHNICAL SKILLS

Cloud Platforms	Microsoft Azure (Compute, Storage, Networking, IAM) · AWS (EC2, S3, VPC, IAM)
Azure Networking	VNet, Subnetting, VNet Peering, Hub-and-Spoke Topology, NSG, Azure Firewall, ExpressRoute, VPN Gateway, Private Endpoints, Application Gateway, Load Balancer, Azure DNS, Route Tables
Cloud Architecture	Azure Landing Zone (Hub-Spoke), HLD & LLD, Well-Architected Framework principles
IaC	Terraform (Modules, State, Workspaces, Remote Backend) — VNet, VM, NSG, Landing Zone provisioning
DevSecOps	tfsec, tflint, Checkov, Gitleaks, Infracost
CI/CD	Azure DevOps (Azure Pipelines, Repos, Boards), GitHub Actions, Trunk-Based Development
Monitoring & Cost	Azure Monitor, Azure Cost Management, Infracost, OpenCost
Scripting	Python, Bash, PowerShell (infrastructure automation & network config scripting)
Databases	PostgreSQL
Version Control	Git, GitHub, Azure Repos
Project Management	Jira, Azure Boards
Operating Systems	Linux (Ubuntu), Windows

INTERNSHIP EXPERIENCE

Associate DevOps Engineer — DevOps Insiders **May 2026 – Present**

India

- Designed and built an Azure Landing Zone using reusable parent-child Terraform modules with a Hub-and-Spoke network topology — hub/spoke VNets, VNet peering, centralized NSGs, and a remote Azure backend for state management.
- Deployed and managed diverse workloads on the Landing Zone, including monolithic applications, Virtual Machines, VM Scale Sets (VMSS), and App Service & App Service Plans.
- Automated runtime configuration and infrastructure provisioning using Linux, Bash, and PowerShell scripting integrated with Terraform (IaC), and provisioned core Azure resources (Resource Groups, Storage Accounts, VMs) via Azure CLI/Portal.
- Used Git and GitHub for version control, and managed work items, sprints, and backlogs using Azure Repos and Azure Boards.
- Implemented a CI/CD pipeline following a trunk-based development strategy and branching best practices, with a dedicated infrastructure pipeline enforcing DevSecOps scanning (tfsec, tflint, Checkov) and Infracost cost estimation before every merge — delivering an error-free, secure, and cost-efficient automated Landing Zone pipeline.
- Built secure file-sharing solutions using Azure Blob Storage with SAS Token-based access control, and monitored/optimized cloud costs using OpenCost, Infracost, and Azure Cost Management dashboards.

PROJECTS

Azure Landing Zone – Monolithic Workload Provisioning with CI/CD (Trunk-Based)

Terraform · Azure DevOps · GitHub · Azure VNet Peering · NSG · Remote State Backend · tfsec · tflint · Checkov · Infracost

- Authored HLD and LLD documentation for a production-style Azure Landing Zone, translating business requirements into a hub-spoke network design with a defined IP addressing plan and clear security boundaries.
- Built the Landing Zone end-to-end in Terraform using a parent-child module architecture — seven reusable child modules driven by nested `map(object(...))` variables — so the same code provisions multiple environments consistently.
- Implemented hub-spoke VNet peering, centralized NSGs, and route tables to enforce segmented, least-privilege network access, and configured a remote Azure backend for Terraform state to enable safe, collaborative, and repeatable deployments.
- Provisioned a monolithic application environment on top of the Landing Zone, with the complete infrastructure deployed through Terraform.
- Built a CI/CD pipeline on Azure DevOps and GitHub following a trunk-based development strategy and branching best practices, so every infrastructure change is validated before it is merged.
- Embedded DevSecOps scanning — tfsec and tflint for security misconfigurations and linting, Checkov for policy compliance — along with Infracost cost estimation, running before every merge to catch insecure, non-compliant, or costly changes early.

Axion System – React + Vite Application CI/CD Pipeline

Azure DevOps · Azure Pipelines · GitHub · React · Vite · PostgreSQL · Terraform · Gitleaks · tfsec · Checkov · Infracost

- Created the Axion System, a React + Vite web application, and connected it to a sample PostgreSQL database to support its data layer.
- Designed and built an application CI/CD pipeline for Axion using Azure Pipelines integrated with GitHub, automating build and deployment on every code push and removing manual release steps.
- Integrated DevSecOps tools into the pipeline — Gitleaks to detect hardcoded secrets in code, and tfsec, tflint, and Checkov to scan the Terraform infrastructure for security and policy issues — so problems are caught early in the delivery flow.
- Added Infracost to the pipeline to estimate the cost impact of Terraform infrastructure changes before every apply, bringing cost visibility into the delivery workflow.

EDUCATION

B.Tech – Computer Science & Engineering, Dr. A.P.J Abdul Kalam Technical University (AKTU) 2022 – 2026
CGPA: 7.8

12th – PCM, UP Board 2021 · 76%

10th – Mathematics, CBSE 2019 · 79.8%

CERTIFICATIONS

- Data Structures & Algorithms Certification – Apna College
